

A B S T R A C T

A DEVICE FOR CLOSING A NECK OF A RECEPTACLE, AND A
RECEPTACLE PROVIDED WITH SUCH A DEVICE

5

The device comprises a removable cap (20) for
closing the neck of a receptacle (3), and a peelable
membrane for hermetically covering the lip of the neck.
In order to guarantee good sealing of the receptacle when
10 it is reclosed with the cap, the peelable layer of the
membrane is adapted to cover only an inner zone (61) of
the lip (6) of the neck (3), the cap being provided
internally with a skirt (24) for bearing in leaktight
manner against an outer zone (62) of the lip that is
15 distinct from the inner zone (61), and said skirt is
plastically deformable between a generally cylindrical
configuration and a flared configuration, the inside face
of said skirt presenting a transmission surface (244) for
transmitting a bearing force (F_2) associated essentially
20 with co-operation between the skirt in its flared
configuration and the lip of the neck.
